## IN THE CLAIMS:

1. (currently amended) A method for producing grain boundary-free polycrystalline silicon, the method comprising: forming a film of amorphous silicon;

using a 2N-shot laser irradiation process to form polycrystalline silicon in a first area of the film, where the film is exposed to a series of 2-shot laser irradiation steps in orthogonal directions, and where "N" is the number of steps in the series;

selecting a second area, included in the first area; and, using a directional solidification (DS) process to anneal the second area.

2. (currently amended) The method of claim 1 wherein exposing the film to a series of 2-shot laser irradiation steps in orthogonal directions, where "N" is the number of steps in the series, includes using a 2N-shot laser irradiation process to form polycrystalline silicon in a first area of the film includes sequencing irradiation in odd and even iteration patterns, the patterns including:

for odd numbered iterations, projecting a first laser beam, in two steps, through a first aperture pattern oriented in a first direction;

[[and,]]

for even numbered iterations, projecting the first laser beam, in two steps, through a second aperture pattern oriented in a second direction orthogonal to the first direction; and,

repeating a sequence of 2-shot orthogonal laser irradiations.

N number of times.

3. (original) The method of claim 2 wherein using a 2N-shot laser irradiation process to form polycrystalline silicon in a first area of the film includes forming in the first area:

a first plurality of parallel grain boundaries oriented in the first direction and having consecutive grain boundaries equally spaced by a first width; and,

a second plurality of parallel grain boundaries oriented in the second direction and having consecutive grain boundaries equally spaced by a second width.

4. (original) The method of claim 3 wherein forming first and second pluralities of grain boundaries having respective consecutive grain boundaries equally spaced by first and second widths, respectively, includes:

selecting the first width in a range of 0.1 microns ( $\mu m$ ) to 100  $\mu m$ ; and,

selecting the second width in a range of 0.1  $\mu m$  to 100  $\mu m.$ 

5. (original) The method of claim 4 wherein selecting the first and second widths in respective ranges of 0.1  $\mu m$  to 100  $\mu m$  includes:

selecting the first width in a range of 0.1  $\mu m$  to 0.6  $\mu m$ ; and, selecting the second width in a range of 0.1  $\mu m$  to 0.6  $\mu m$ .

6. (original) The method of claim 5 wherein selecting the first and second widths in respective ranges of 0.1  $\mu$ m to 0.6  $\mu$ m includes:

selecting the first width in a range of 0.3  $\mu m$  to 0.6  $\mu m$ ; and, selecting the second width in a range of 0.3  $\mu m$  to 0.6  $\mu m$ .

7. (original) The method of claim 4 wherein selecting the first and second widths in respective ranges of 0.1  $\mu m$  to 100  $\mu m$  includes:

selecting the first width in a range of 0.6  $\mu$ m to 10  $\mu$ m; and, selecting the second width in a range of 0.6  $\mu$ m to 10  $\mu$ m.

8. (original) The method of claim 4 wherein selecting the first and second widths in respective ranges of 0.1  $\mu m$  to 100  $\mu m$  includes:

selecting the first width in a range of 10  $\mu m$  to 100  $\mu m$ ; and, selecting the second width in a range of 10  $\mu m$  to 100  $\mu m$ .

- 9. (original) The method of claim 3 wherein forming first and second pluralities of grain boundaries with first and second widths, respectively, includes selecting the first and second widths to be equal.
- 10. (original) The method of claim 3 wherein sequencing irradiation in odd and even iteration patterns includes performing one odd iteration and one even iteration.
- 11. (currently amended) The method of claim 3 wherein using a DS process to anneal the second area includes:

subsequent to forming polycrystalline silicon in the first area, selecting a third aperture pattern and a second area with a top surface; orienting the third aperture pattern and a second area top surface in the first direction;

projecting a second laser beam through the third aperture pattern as follows: to anneal a first portion of the second area; sequentially:

advancing the third aperture pattern and the second area top surface in the first direction;

projecting the second laser beam through the third aperture pattern; and,

sequentially annealing remaining portions of the second area; and,

selectively removing grain boundaries in the second area.

12. (original) The method of claim 11 wherein selectively removing grain boundaries in the second area includes:

smoothing ridges formed by the first and second pluralities of grain boundaries; and,

removing grain boundaries with the exception of first plurality grain boundaries.

13. (original) The method of claim 12 wherein selecting the second area includes:

selecting a first pair of sides parallel to and located between first plurality grain boundaries; and,

selecting a second pair of sides parallel to and located between second plurality grain boundaries.

- 14. (currently amended) The method of claim 13 wherein selecting a first pair of sides located between first plurality grain boundaries includes <u>co-locating</u> selecting at least one first pair side <del>to be</del> to located on a first plurality grain boundary.
- 15. (currently amended) The method of claim 13 wherein selecting a first pair of sides located between first plurality grain boundaries includes selecting a first pair of sides located between consecutive grain boundaries from the first plurality of grain boundaries.
- 16. (currently amended) The method of claim 15 wherein selecting a first pair of sides located between consecutive first plurality grain boundaries includes <u>co-locating</u> selecting at least one first pair side to be co-located on a consecutive first plurality grain boundary.
- 17. (currently amended) The method of claim 13 wherein selecting a second pair of sides located between second plurality grain boundaries includes <u>co-locating</u> selecting at least one second pair side to be co-located on a second plurality grain boundary.
- 18. (currently amended) The method of claim 11

  wherein using the 2N-shot laser irradiation process to form

  polycrystalline silicon in the first area of the film includes performing a final laser irradiation shot in the first direction

wherein orienting the third aperture pattern and a second area top surface in the first direction includes selecting the first direction the same as a direction of a last iteration in a 2N-shot iteration sequence performed on the first area.

19. (original) The method of claim 3 wherein projecting a first laser beam through first and second aperture patterns includes using a first excimer laser source with a wavelength between 248 nanometers (nm) and 308 nm to supply the first laser beam; and,

wherein projecting a second laser beam through a third aperture pattern includes using a second excimer laser source with a wavelength between 248 nm and 308 nm to supply the second laser beam.

20. (original) The method of claim 3 wherein projecting a first laser beam through first and second aperture patterns includes projecting the first laser beam for a pulse duration of up to 300 nanoseconds (ns); and,

wherein projecting a second laser beam through a third aperture pattern includes projecting the second laser beam for a pulse duration of up to 300 ns.

- 21. (original) The method of claim 20 wherein projecting a first laser beam through first and second aperture patterns includes projecting the first laser beam for a pulse duration of up to 30 ns.
  - 22. canceled

23. (original) The method of claim 20 wherein projecting the second laser beam through the third aperture pattern includes projecting the second laser beam for a pulse duration of up to 30 ns.

## 24. canceled

25. (currently amended) The method of claim 3 wherein using a 2N-shot laser irradiation process to form polycrystalline silicon in a first area of the film projecting a first laser beam to anneal the first area includes:

exposing the first area to a first energy density from the first laser beam;

the method further comprising:

projecting a third laser beam, with a second energy density, onto the first area; and,

exposing the first area to a second energy density from the third laser beam; and,

wherein annealing the first area includes:

summing the first and second energy densities to yield a third energy density; and,

annealing the first area in response to the <u>first and second</u> third energy <u>densities</u> density.

26. (original) The method of claim 25 wherein projecting a third laser beam onto the first area includes projecting, from

a solid state laser source, a third laser beam with a wavelength of 532 nm and a pulse duration of between 50 ns and 150 ns.

- 27. (original) The method of claim 25 wherein projecting a third laser beam onto the first area includes projecting, from a carbon dioxide (CO<sub>2</sub>) laser source, a third laser beam with a wavelength in a range of 10.2  $\mu$ m to 10.8  $\mu$ m and a pulse duration of up to 4 milliseconds (ms).
- 28. (currently amended) The method of claim 3 wherein using a 2N-shot laser irradiation process to form polycrystalline silicon in a first area of the film projecting a first laser beam to anneal the first area includes exposing:

the first area to a fourth energy density from the first laser beam;

the method further comprising:

exposing the first area to a first lamp light <u>having a fifth</u> energy density; and

exposing the first area to a fifth energy density from the first lamp light; and,

wherein annealing the first area includes:

summing the fourth and fifth energy densities to yield a sixth energy density; and,

annealing the first area in response to the <u>fourth and fifth</u> sixth energy <u>densities</u> density.

- 29. (original) The method of claim 28 wherein exposing the first area to a first lamp light includes exposing the first area to light from an excimer lamp with a wavelength less than 550 nm.
- 30. (currently amended) The method of claim 28 wherein exposing the first area to a first lamp light includes exposing the substrate underlying a first bottom surface of the amorphous silicon film including the first area.
- 31. (currently amended) The method of claim 28 wherein exposing the first area to a first lamp light includes exposing a first top surface of the amorphous silicon film including the first area.
- 32. (currently amended) The method of claim 11 wherein projecting a second laser beam to anneal the second area includes:

exposing the second area to a seventh energy density from the second laser beam;

the method further comprising:

projecting a fourth laser beam onto the second area <u>having</u> an eighth energy density; and,

exposing the second area to an eighth energy density from the fourth laser beam; and,

wherein annealing the second area includes:

summing the seventh and eighth energy densities to yield a ninth energy density; and,

annealing the second area in response to the <u>seventh and</u>

<u>eighth energy densities</u> ninth energy density.

- 33. (original) The method of claim 32 wherein projecting a fourth laser beam onto the second area includes projecting, from a solid state laser source, a fourth laser beam with a wavelength of 532 nm and a pulse duration of between 50 ns and 150 ns.
- 34. (original) The method of claim 32 wherein projecting a fourth laser beam onto the second area includes projecting, from a  $CO_2$  laser source, a third laser beam with a wavelength in a range of 10.2  $\mu m$  to 10.8  $\mu m$  and a pulse duration of up to 4 ms.
- 35. (currently amended) The method of claim 11 wherein projecting a second laser beam to anneal the second area includes:

exposing the second area to a tenth energy density from the second laser beam;

the method further comprising:

exposing the second area to a second lamp light <u>having an</u>
<u>eleventh energy density;</u> and

exposing the second area to an eleventh energy density from the second lamp light; and,

wherein annealing the second area includes:

summing the tenth and eleventh energy densities to yield a twelfth energy density; and,

annealing the second area in response to the <u>tenth and</u> <u>eleventh energy densities</u> <del>twelfth energy density</del>.

- 36. (original) The method of claim 35 wherein exposing the second area to a second lamp light includes exposing the second area to light from an excimer lamp with a wavelength less than 550 nm.
- 37. (currently amended) The method of claim 35 wherein exposing the second area to a second lamp light includes exposing the substrate underlying a second bottom surface of the amorphous silicon film including the second area.
- 38. (currently amended) The method of claim 35 wherein exposing the second area to a second lamp light includes exposing a second top surface of the amorphous silicon film including the second area.
- 39. (currently amended) The method of claim 11 further comprising:

forming a transparent substrate layer;

forming a diffusion barrier overlying the substrate <del>layer</del> and underlying the first area;

wherein forming the film of amorphous silicon includes forming the film overlying the diffusion barrier;

the method further comprising:

subsequent to annealing the second area, forming in the second area, a transistor channel with a length[[,]] oriented in the first direction, and a width;

forming in the first area, source and drain regions adjacent to, and interposing the channel region;

forming a gate dielectric layer overlying the transistor channel, source, and drain regions, the dielectric thickness in a range of 20 angstroms (A) to 500 A over the channel region; and,

forming a gate electrode overlying the gate dielectric layer.

40. (currently amended) The method of claim 39 wherein forming a channel region with a length includes forming the channel length with a first pair of sides parallel to and located between a pair of grain boundaries from the first plurality grain boundaries; and,

wherein forming a channel region with a width includes forming the channel width with a second pair of sides parallel to and located between a pair of grain boundaries from the second plurality grain boundaries.

- 41. (currently amended) The method of claim 40 wherein forming the channel length with a first pair of parallel sides located between a pair of first plurality grain boundaries includes colocating at least one side from the first pair on one of the grain boundaries from the [[a]] first plurality of grain boundaries boundary.
- 42. (currently amended) The method of claim 40 wherein forming the channel length with a first pair of parallel sides

located between a pair of first plurality grain boundaries includes forming the channel length with a first pair of parallel sides located between a pair of consecutive grain boundaries from the first plurality of grain boundaries.

- 43. (currently amended) The method of claim 42 wherein forming the channel length with a first pair of parallel sides located between a pair of consecutive first plurality grain boundaries includes co-locating at least one side from the first pair on one of the grain boundaries from the [[a]] first plurality of grain boundaries boundary.
- 44. (currently amended) The method of claim 40 wherein forming the channel width with a second pair of parallel sides located between a pair of second plurality grain boundaries includes colocating at least one side from the second pair on one of the grain boundaries from the [[a]] second plurality of grain boundaries boundary.
